HEALTH

# Age structure and mixing patterns

Session 7

R. RANDALL ROLLINS BUILDING

# Outline

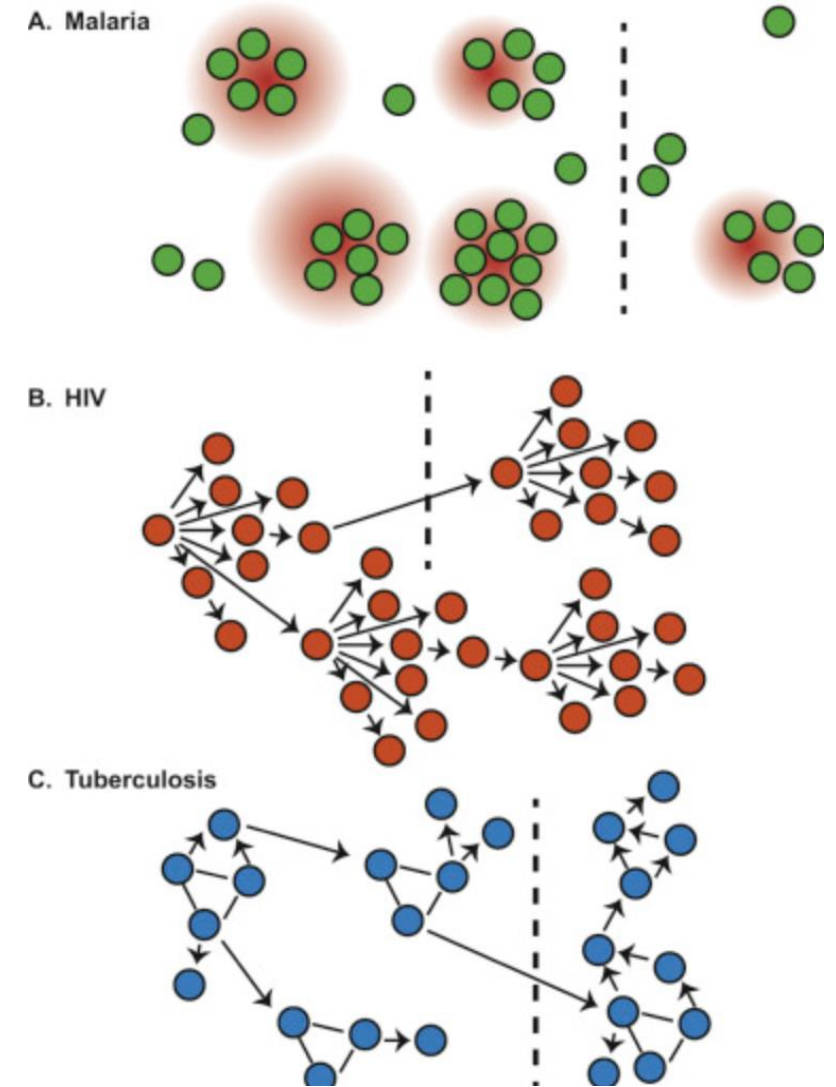

1. Effective 'contacts' and why they matter
  2. How to measure contact?
  3. The GlobalMix study
- 

# Respiratory and enteric infections

Centrality of **human** behavior

Direct, person-to-person transmission

- contacts ubiquitous
- communities, households

# Social contact data is a key input into transmission models

S = susceptible  
I = infected  
R = recovered

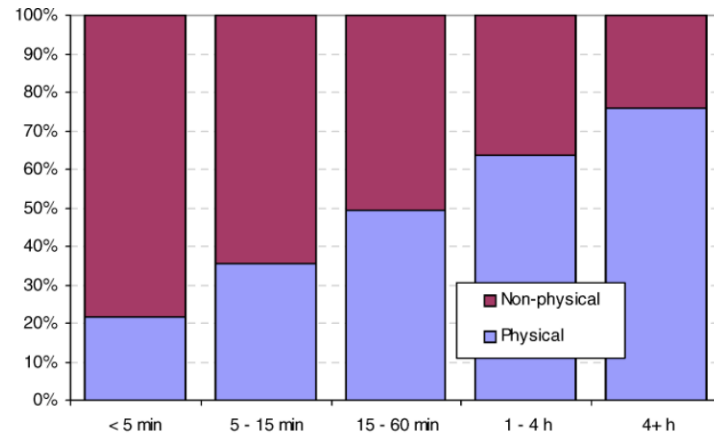

$$\lambda = \beta * I_t$$

# Defining 'contacts'

## Definition of an (effective) contact

- Often difficult to know
  - How many contacts that could have led to respiratory / enteric disease transmission did you have yesterday?
- $\lambda = \beta * I_t$ 
  - $\beta$  is **per-capita rate of effective contact** and can be estimated from a model (often is) but hard to measure empirically

# Social contact patterns: who interacts with whom?

IT

DE

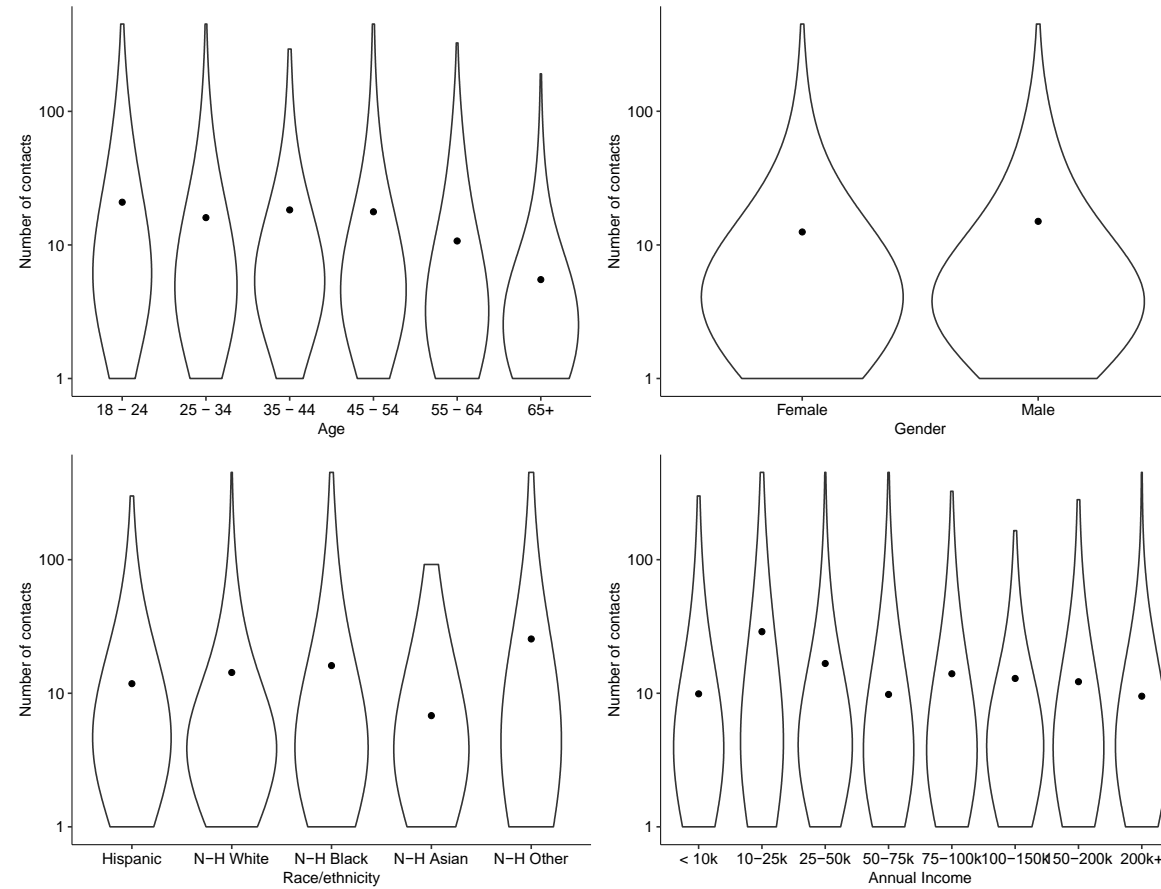

GB

# Social contact patterns change through time

# Social contacts rates differ within populations

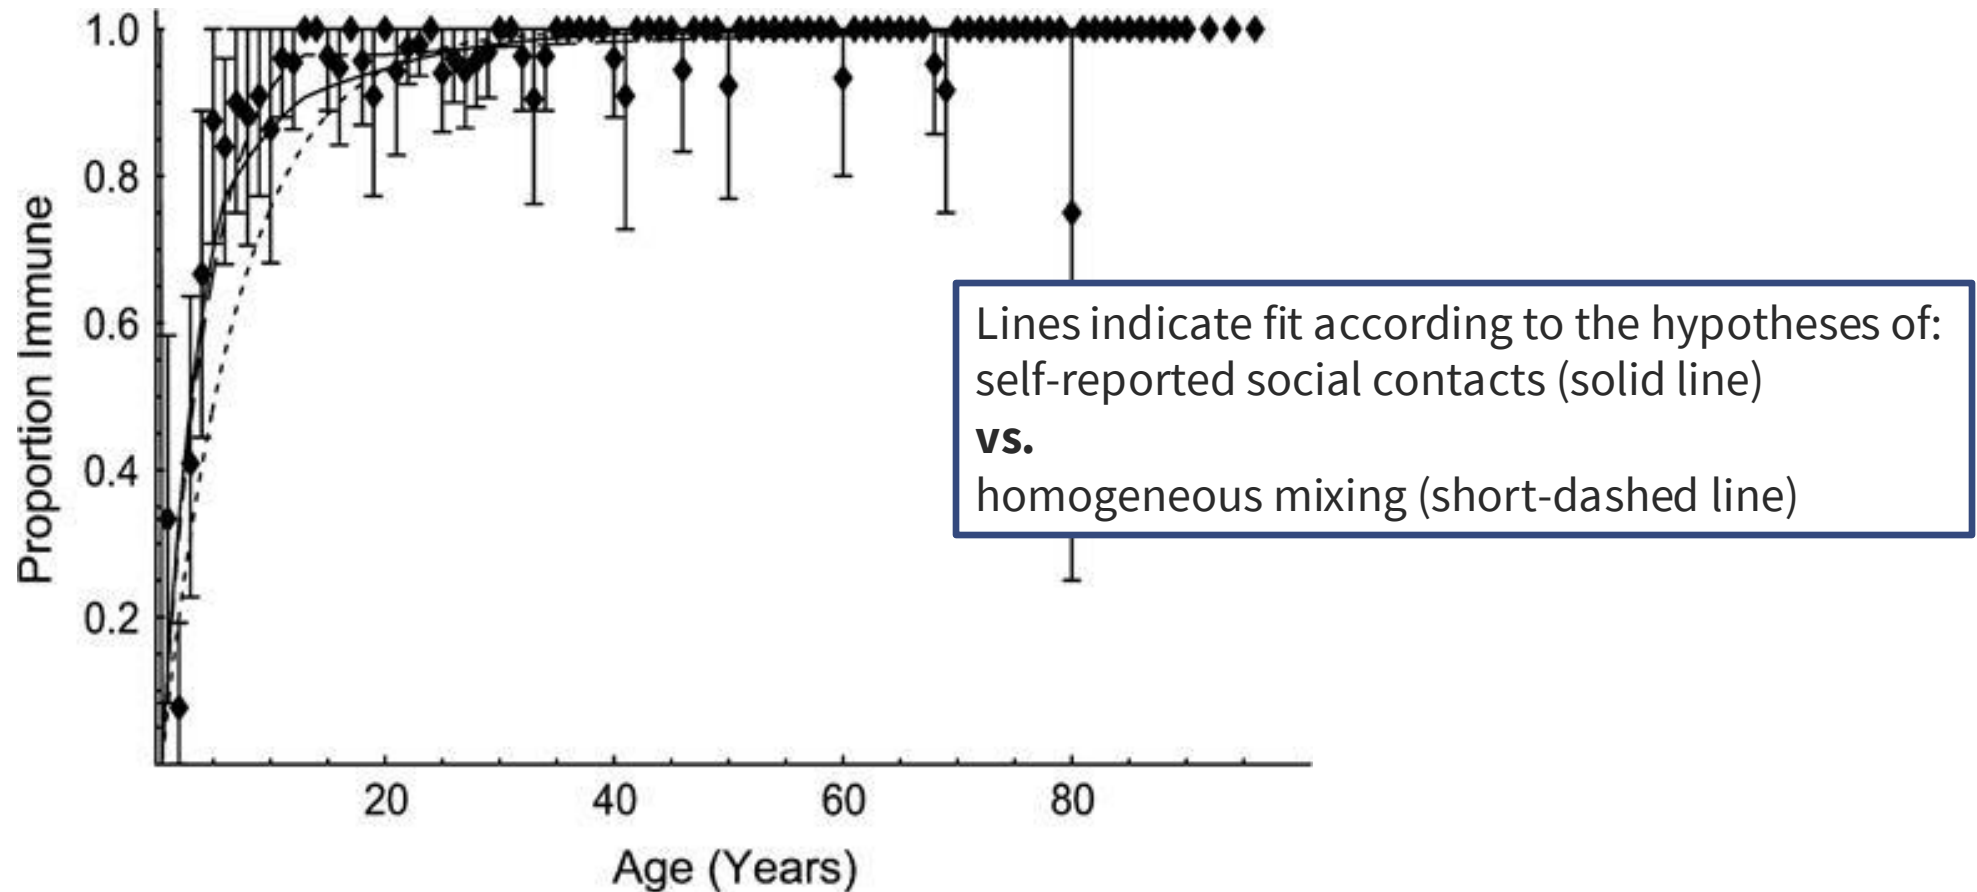

# Model outputs depend on assumptions about social contact patterns

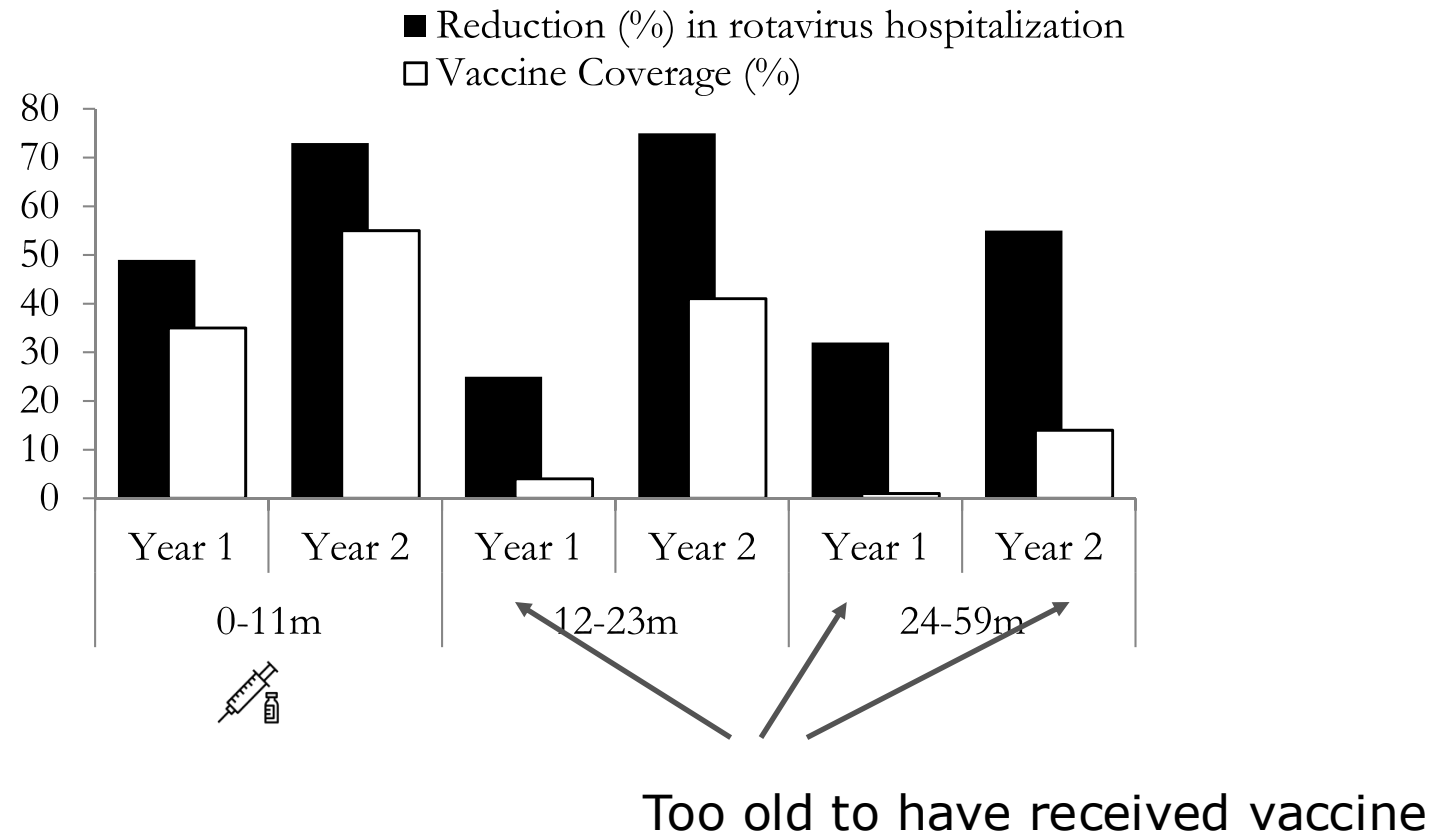

# Social contact patterns, as measured in those studies, are linked with infection risk

# Measuring transmission-reducing effects of vaccines

Rotavirus hospitalization data for two years  
post-rotavirus vaccine introduction in Moldova

# Indirect (transmission-reducing) vaccine effects

## Indirect (transmission-reducing) vaccine effects

Infected despite being vaccinated, but **less infectious**

# Data from Europe has been used to project social contact patterns in many other countries

## RESEARCH ARTICLE

## Projecting social contact matrices in 152 countries using contact surveys and demographic data

## In low- and middle-income countries, more contacts at home and among older adults

# The GlobalMix study

**Objective:** Characterize social mixing patterns across rural and urban settings in four countries: Guatemala, India, Mozambique, Pakistan

# The GlobalMix study design

Extensive qualitative work to inform data collection procedures

- Aguolu and Kiti *et al.* 2024

600 participants per site across age range

- 1200 per country

Two modes of data collection

- Individuals: 2-day contact diary
- Households: 5-day RFID sensors + contact diary

Oversample children (~25% under 5)

## PLOS ONE

STUDY PROTOCOL

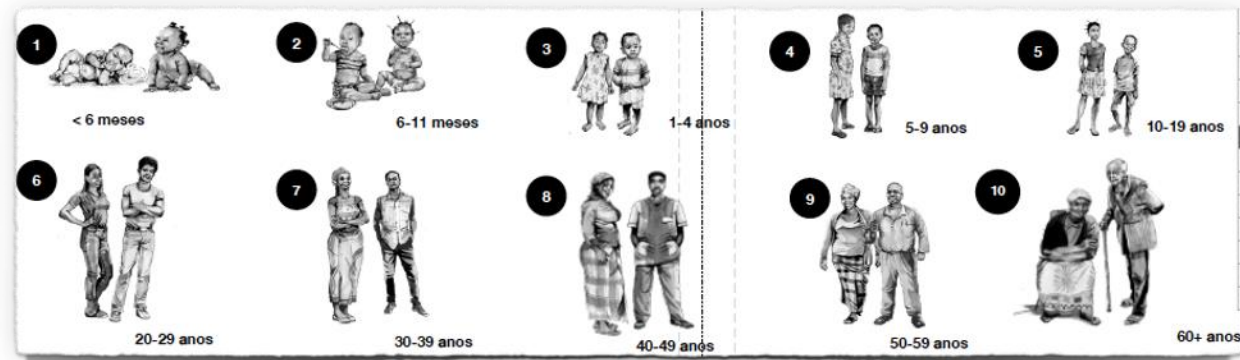

Comprehensive profiling of social mixing patterns in resource poor countries: A mixed methods research protocol
